

## **VI. CONTINGENCY ROUTING**

### **A. CURRENT PROCEDURES DURING PORT CONSTRUCTION AND DREDGING:**

Construction and channel dredging projects may affect vessel navigation. The LALB Harbor Safety Committee reviews and evaluates the adequacy of any changes needed in the traffic and routings from port construction and dredging projects and procedures for routing vessels during emergencies that impact navigation.

When planning a port construction or dredging project, the contractors are to meet with pilot organizations, the Coast Guard, and the affected port authority to establish safety and communication procedures for vessels and pilots, and define any proposed restrictions on vessel movements.

Once construction or dredging begins, these representatives meet regularly as needed to ensure navigational safety and provide up-to-date information to vessels and pilots. Weekly meetings and close coordination will proceed smoothly without compromising safe vessel movement.

See Chapter V, “Harbor Depths, Channel Design, and Proposed Construction and Dredging,” for information regarding current and future projects, some of which may impact vessel navigation and routing.

**B. VESSEL ROUTING DURING EMERGENCIES:** The USCG COTP has developed procedures and instructions for vessel movements during emergencies. See USCG COTP’s Merchant Vessel Dispersal Plan for Los Angeles – Long Beach Harbors in Appendix D of this Harbor Safety Plan.

**C. FINDINGS:** The Committee finds the current procedures for contingency routing during port construction and during emergencies are adequate, and no changes are needed.
